

To the city of Tecumseh,

As a resident of Windsor I find it disturbing that fluoride may be re-introduced into our municipal water. Fluoride is a known carcinogen and the Windsor region has one of the highest rates of Cancer in all of Canada. I think it would serve our community to find ways of reducing cancer rates in the community instead of adding to them. I don't know of any long term studies on the matter and I don't wish for myself, friends, colleagues, neighbours and community members to be experimented on. I am not a guinea pig and I strongly feel that more research is needed on this topic. There must be other ways of improving the quality of residents and children's teeth and dental hygiene. Perhaps we could persuade them to eat less sugar and have fewer fast food chains. or perhaps we could have healthy cooking lessons.

Please do better for everyone involved in the community.

Thanks,

Lauren Laplante
